latex rubber coating

Felcoid/Plus Oil Pan Gasket  
fiber sheet core

## Oil Pan Gaskets for Marine Applications

Each FEL-PRO® Marine Oil Pan Gasket is specially designed for the tough demands of specific marine engines. Two general design approaches are used:

Felcoid/Plus® gaskets have a fiber sheet core and a latex rubber coating. The latex aids in sealing potential leakage paths. The core material resists crushing and splitting, while

providing excellent blowout resistance. The lateral stability of the fiber core helps the gasket resist deformation under high-vacuum conditions. The fiber core provides a “stopper” effect when the oil pan is torqued down. Softer materials sometimes do not provide the “feel” that they’ve been properly torqued. The Felcoid/Plus gasket has a distinct feel when it is properly torqued.

Also available are FEL-PRO Marine Oil Pan Gaskets using the one-piece molded rubber construction of newer engine designs. These silicone rubber one-piece gaskets provide perfect fit, are easier to install, include compression limiters to prevent overtightening, and offer superior heat resistance. They have either a solid steel core or a rigid carrier design as required by application.

## Special Marine Crankshaft Seals Available

The FEL-PRO® Marine Gaskets line offers optional timing cover seals and rear main bearing seals for reverse rotation engine applications. The standard engine rotation direction is counterclockwise (left hand) flywheel rotation. However, in certain engine installations (such as V-Drive) reverse engine rotation is used. Reverse engine rotation direction is clockwise (right hand) flywheel rotation. It is critical to determine engine rotation before selling crankshaft seals for a marine application. The two different types of

seals have different helixes on the sealing lip to direct oil back into the engine, so using the wrong seal can actually direct oil out of the engine. Be sure you know which type your customer’s engine uses when selecting crank seals.

Remember that propeller rotation is NOT always the same as engine rotation. Do not rely on propeller rotation to determine correct engine rotation.

## VARIETY OF WAYS TO SEAL MARINE VALVE COVERS

### FEL-PRO Blue Stripe® cork-rubber

is the most frequently used material. FEL-PRO Blue Stripe® premium-quality cork-rubber gaskets use evenly-sized cork particles evenly distributed throughout a rubber binder. The result is a compressible gasket without leak paths. These gaskets are generally a little thicker than their standard passenger vehicle counterparts.

### Fel-CoPrene® synthetic rubber

can offer a longer life than cork-rubber. However, because it is more flexible than cork-rubber, it can be more difficult to install. Generally, a quick-drying contact adhesive should be used to bond the gasket to the valve cover before installation.

### Rubber-coated fiber

is used for some high-heat applications, such as Chrysler big-block V8 engines, where the valve cover is in close proximity to the exhaust manifold. The excess heat contributes to premature deterioration of most valve cover gaskets and leads to leaks. For these high-heat applications, there is a gasket available made of stiff, high-temperature fiber material coated with latex rubber.

### Molded silicone rubber

gaskets provide for ease of installation, and are great for on-again/off-again situations (like setting valve lash). These gaskets feature high-tech silicone material for long life and sealability, a solid steel core for strength and durability, and stainless steel compression limiters to prevent overtightening. This is an excellent choice for high-vacuum marine engines.

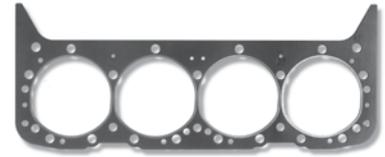

## FEL-PRO® MARINE GASKET SET CONTENTS

All gasket sets in the FEL-PRO Marine Gasket line are “job specific” – you choose the correct gasket set for the specific repair job being done, without wasting money on extra automotive-style gaskets that are not used on marine engines. Here are the typical set contents of each type of FEL-PRO Marine Gaskets set, along with an illustration of a typical set in each series:

### **17000 series Head Gaskets:**

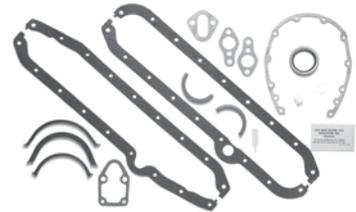

Single-packed cylinder head gaskets.

**17000 series**

### **17100 series Conversion Sets:**

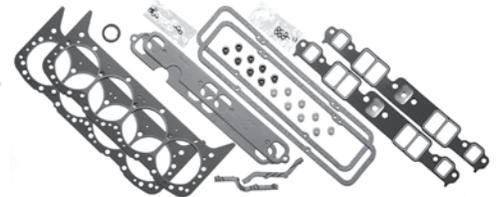

All the gaskets and oil seals not found in a Head Set, that are necessary for a complete engine overhaul. This includes timing cover gaskets and seals, oil pan gaskets, and rear main bearing seals.

**17100 series**

### **17200 series Head Sets:**

All the gaskets and seals necessary for a valve grinding job, including cylinder head gaskets, valve cover gaskets, intake & exhaust manifold gaskets, and valve stem seals.

**17200 series**

### **17300 series Intake Manifold Sets:**

Intake manifold side gaskets, intake manifold end seals, and distributor mounting gasket.

**17300 series**

### **17400 series Exhaust Manifold Sets:**

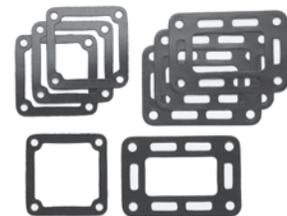

Exhaust manifold (manifold-to-cylinder head) gaskets.

**17400 series**

### **17500 series Exhaust Manifold Cooling Sets:**

All the gaskets needed to rebuild the water-cooled exhaust manifold, exhaust elbow, and exhaust riser (other than the exhaust manifold-to-cylinder head gaskets). Set contents are designed for specific marine engine applications.

**17500 series**

### **17600 series Thermostat Housing Sets:**

All the gaskets needed to repair the thermostat housing/ water distribution system. Set contents are designed for specific marine engine applications.

**17600 series**

# FEL-PRO® MARINE GASKET SET CONTENTS

## 17700-17749 series Reverse Rotation Rear Main Bearing Seal Sets:

Rear main bearing seals designed to seal a crankshaft which rotates in the opposite direction from normal (standard rotation seal is included in Conversion Set).

17700-17749 series

17700-17749 series

## 17750-17799 series Reverse Rotation Timing Cover Seal Sets:

Timing cover seals designed to seal a crankshaft which rotates in the opposite direction from normal (standard rotation seal is included in Conversion Set and Timing Cover Set).

17750-17799 series

## 17800-17869 series Carburetor Mounting Gaskets:

Single-packed carburetor mounting gaskets, throttle body mounting gaskets, and plenum gaskets.

17800-17869 series

17800-17869 series

## 17870-17899 series Timing Cover Sets:

All the timing cover gaskets and seals required for one engine, including front oil pan seal and water pump gaskets.

17870-17899 series

## 17900-17949 series Valve Cover Sets:

All valve cover or push rod cover gaskets (and grommets if required) required to seal one engine.

17900-17949 series

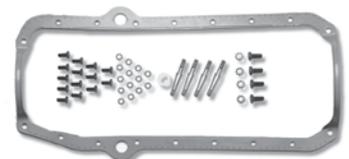

17900-17949 series

## 17950-17999 series Oil Pan Sets:

All oil pan side gaskets and end seals, or one-piece molded rubber oil pan gasket, required to seal one engine.

17950-17999 series

17950-17999 series

## HOW TO USE THIS CATALOG

All marine manufacturers are arranged in alphabetical sequence with the manufacturer's name appearing in bold-face type at the outer margins of each page. The preceding Table of Contents will help to easily locate the desired manufacturer. Each manufacturer listing also includes information on all separate model lines and which engines are available for particular models.

Each marine manufacturer listing has three distinct sections.

The **first** section, found at the beginning of each listing, is a complete index of all engines included in that manufacturer. The engines are arranged in ascending order by displacement, either by CID or CC as appropriate.

The **second** section is comprehensive model data for that manufacturer, including all available engine/horsepower combinations for each model line. The models are sorted in alphabetical order under each individual marque, and include horsepower ratings to aid identification of the correct engine.

The **third** section of each manufacturer listing includes all engine gaskets available for that manufacturer. The engines are arranged in one running sequence, in ascending numerical order by displacement. Domestic manufacturers are arranged by CID size and imported manufacturers are arranged by CC size. The header block for each engine contains detailed information on liter designation, engine size, valvetrain layout, cylinder configuration, bore size, and engine manufacturer. Complete model information and horsepower ratings

are also included to aid engine identification. Following the header block all available gaskets are shown in this sequence:

Head Gaskets

Exhaust Manifold Cooling Sets  
Oil Pan Sets  
Rear Main Bearing Seal Sets  
Valve Cover Sets  
Push Rod Cover Sets  
Thermostat Housing Sets  
Timing Cover Sets  
Timing Cover Seal Sets

For each individual entry, part numbers are shown in bold type. The "Description" column contains detailed notes on exact application information, gasket designs, premium gasket materials included, and if an additional set is required to complete the repair job. Carburetor and Fuel Injection gaskets are listed separately with complete descriptions and silhouettes.

A complete numerical listing of all the engine gasket part numbers included in this catalog appears at the end of the last manufacturer section. It references every appearance of each part number in this catalog, coded by manufacturer abbreviation and line number of each section where it appears. An abbreviations list of all the manufacturers may be found below on this page.

Chevrolet Big Block engines produced from 1965-90 are designated MARK IV or GEN IV. The next generation, produced from 1991-95 are known as MARK V or GEN V. The new generation (MARK VI or GEN VI) has been produced since 1996. There are head gasket interchangeability problems between these three series of engines. The FEL-PRO® head gasket

part numbers 17042 (454 standard), 17046 (454 high performance), 17048 (502-510-540-572 standard bore), and 17049 (502-510-540-572 overbored) are designed to fit Generation V engines and Generation IV truck and Bow Tie race blocks without modifications. They can also be used on the Generation IV passenger car and performance blocks, if additional coolant holes are added as shown here.

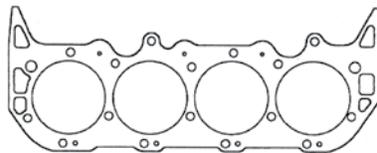

These three lower holes must be present in the block. Add as required.

**THESE FOUR GASKETS MUST BE USED ON BLOCKS THAT HAVE ALL THREE LOWER COOLANT HOLES.**

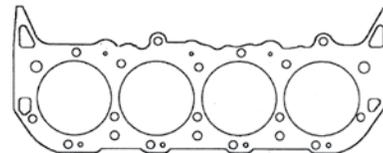

Generation V and VI blocks have large core holes located in the front of each bank adjacent to the dowel tubes. To direct the coolant flow toward the exhaust side of the engine, Generation V and VI gaskets block these holes off.

Generation IV gaskets have holes in these locations, so an excessive amount of coolant will be transferred across the front, causing other areas of the engine to run too hot.

**Short Upper Contour (Gen. IV)**

**Extended Upper Contour (Gen. V and VI)**

## GM MARINE 153/181 ENGINES

There is a great degree of similarity in design between the four different FEL-PRO® Intake & Exhaust Manifold gaskets available for the Chevrolet 153 (2.5L) and 181 (3.0L) engines. In instances where the Engine Manufacturer/Model Number/Serial Number plate is missing from the engine, it

can be very difficult to determine the correct manifold gasket for the engine being repaired. To help you identify the correct gasket required, please consult the illustrations shown below, listed with their correct model applications.

### Open (or Raw Water, Sea Water) Cooling System

In this type of system, water is drawn in from outside the boat, circulated through the engine, and then expelled through the exhaust system.

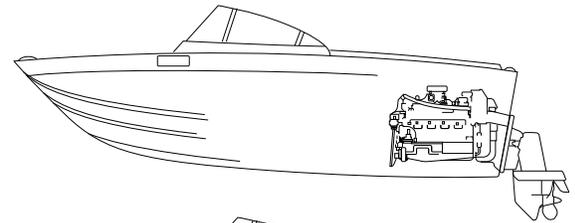

### Closed (or Fresh Water) Cooling System

An antifreeze/water solution circulates through the engine, then into the heat exchanger (passing around the outside of the heat exchanger core tubes), and then back into the engine. "Raw" water is drawn in from outside the boat, circulates through the inside of the heat exchanger core tubes (cooling the engine coolant), and is then expelled through the exhaust elbows and exhaust lines. The presence of a heat exchanger makes this system easily recognizable.

## MARINE ENGINE/DRIVE VARIATIONS

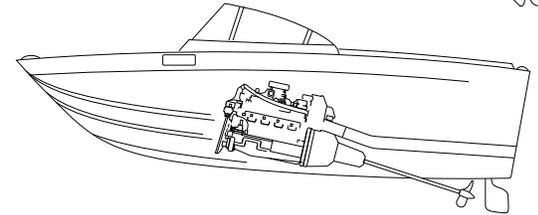

### Stern Drive (Inboard/Outboard, Outdrive)

The engine is mounted inside the boat. The transmission/drive unit is outside, attached to the transom. The engine and drive unit are joined by a torque coupler and universal joint. Angling the drive steers the boat.

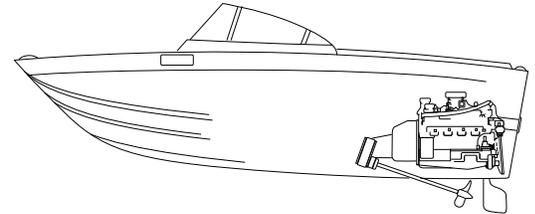

### Inboard

The engine and transmission/drive unit are inside the boat. A drive shaft is connected to the rear of the transmission and is run out of the hull through a sealing unit. The propeller is connected directly to the drive shaft at the in-water end. A separate rudder steers the boat.

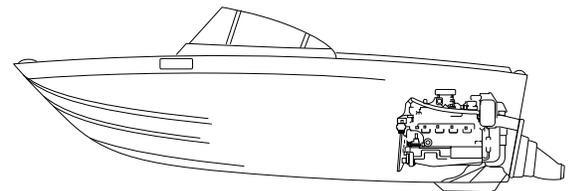

### V-Drive

Basically a modified inboard installation. The engine is mounted with the front (pulley end) facing the stern (rear). The transmission faces the bow (front), and by use of a universal joint on the end of the transmission, the drive shaft is directed towards the stern under the engine and through the hull. The propeller/rudder arrangement is the same as in a standard inboard installation.

### Jet Drive

The engine is mounted inside the boat and attached to a high speed pump which draws in water through an intake grate, increases its velocity, and forces it out through a directionally adjustable nozzle which is mounted outside the boat. Changing the direction of the nozzle steers the boat.

## MARINE ENGINE ROTATION

The FEL-PRO® Marine Gaskets line offers optional timing cover seals and rear main bearing seals for reverse rotation engine applications (such as V-Drive installations).

Engine rotation direction is determined by observing FLYWHEEL rotation from the flywheel end of the engine, looking forward to the pulley end of the engine.

Normal (Standard) Rotation: Counter-clockwise (left hand) flywheel rotation.

Reverse (Opposite) Rotation: Clockwise (right hand) flywheel rotation.

It is critical to determine engine rotation direction before selling crankshaft seals for a marine application. The two different types of seals have different helixes on the sealing lip to direct oil back into the engine, so using the wrong seal can actually direct oil out of the engine.

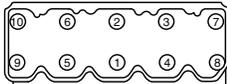

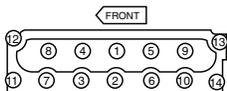

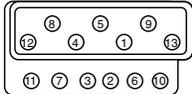

NOTE: Propeller rotation is NOT necessarily the same as engine rotation. Do not rely on propeller rotation in determining engine rotation.

## HEAD BOLT TORQUE SPECIFICATIONS

- Use 190,000 psi fasteners minimum.
- Wire brush bolt threads and fine stud threads to remove coating.
- Use moly or anti-seize lubricant only. DO NOT use oil.
- Apply lube to both sides of washers, and under bolt heads or nuts.
- Lube bolts that go into water jackets with TEFLON® sealer.
- Install studs with sealer.

## TORQUE-TO-YIELD HEAD BOLTS

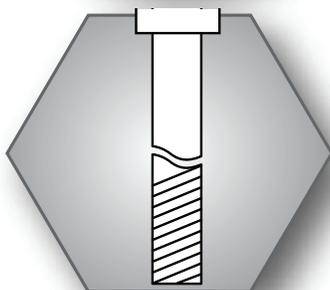

Beginning in the 1992 model year, all Ford 302 (5.0L) engines were assembled at the factory using Torque-To-Yield head bolts. The illustration below shows the visual differences between standard head bolts and Torque-To-Yield head bolts.

### Identifying Torque-To-Yield Bolts

#### Torque-To-Yield (Flanged Hex Head)

Flanged head is typical.  
Threads usually run 75-100%  
of the length of the shaft.

#### Standard Hex Head

Head without flange is typical.  
Threads usually **do not** run the  
length of the shaft.

As the torque specifications and procedures for these two types of head bolts differ, they must NEVER be used in combination in the same engine. Either all standard head bolts, or all Torque-to-Yield head bolts, must be used on an engine. Ford also specifies that the Torque-To-Yield bolts must NOT be reused. Always use a new set of head bolts each time a head is re-installed on an engine using this type of head bolt.

Follow these torque specifications for 1992 and later Ford 302 (5.0L) engines with Torque-To-Yield head bolts:

- 1st step – Torque all bolts to 25-35 ft.-lbs.
- 2nd step – Increase torque on all bolts to 45-55 ft.-lbs.
- 3rd step – Torque all bolts an additional 85-95 degrees.

# THE BEST MARINE GASKETS MADE FOR INBOARD AND STERN DRIVE BOAT ENGINES

## FEL-PRO® Marine Cylinder Head Gaskets: The Choice for Both Salt Water and Fresh Water

FEL-PRO Marine Head Gaskets are designed and cataloged specifically for 4-cycle marine engine applications. They assure the installer of dependable engine sealing in salt water or fresh water – the gasket materials are compatible with either environment.

Today's marine engines are developing more horsepower and running at higher RPM than ever before. These engines need an extra measure of protection against combustion seal burnout, and increased blowout resistance. That's why FEL-PRO engineers combine the best features of the race-proven Performance Head Gaskets into the trouble-free Marine Head Gaskets.

The Marine Head Gaskets use gasket core and combustion armors made of 300 series stainless steel to resist rust and corrosion, anti-stick surface coatings to improve micro-sealing, PermaTorque® construction to minimize torque loss, and Printoseal® elastomeric sealing beads where required for positive coolant sealing. When needed, wire ring combustion seals are also used for demanding applications like big-block Chevrolet V8 and big-block Ford V8 engines.

## Marine Intake Manifold Gaskets and End Seals

FEL-PRO® Marine Intake Manifold Gaskets are designed without a metal core, to allow engine builders to trim the gasket for exact fit on modified ports. The base gasket material resists coolant, gasoline, alcohol, and oil. Printoseal® elastomeric sealing beads are used to provide the extra sealing strength needed around the ports. The gaskets also have an anti-stick coating to improve micro-sealing and to make gasket removal and clean-up easier, while preventing gasket failure due to intake manifold and cylinder head movement.

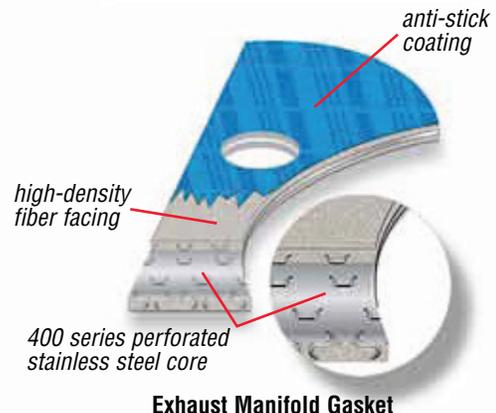

Modifications made to marine engines often change the size of the end gap between the intake manifold and the block. Since cork-rubber can seal a wider range of gaps than molded rubber, the end seals included with FEL-PRO Marine Intake Manifold Gaskets are Blue Stripe® cork-rubber. They have a pre-applied contact adhesive on one side to aid installation. On very narrow gaps, carefully applied RTV silicone sealant can also be used in place of the cork-rubber end seals.

## Marine Exhaust Manifold and Exhaust Cooling Gaskets

FEL-PRO Marine Exhaust Manifold Gaskets are designed for reliable sealing in the high-heat environment of marine engines. They use a perforated gasket core made of 400 series stainless steel to resist rust and corrosion, high-temperature fiber facing material on both sides of the core to prevent exhaust burnout, and special anti-stick coating to provide improved micro-sealing.

Special marine exhaust manifold cooling sets are also available. Each set is designed for a specific marine engine application, unlike the wasteful "universal" sets sold by other suppliers. The sets contain all the necessary gaskets to rebuild the water-cooled exhaust manifold, exhaust elbow, and exhaust riser on a marine engine.
